Notes/Tuning Information (Continued)

Most benchmarks are built using one or more types of
profile-driven feedback. The types used are designated
by abbreviations in the notes:

+CFB: Code generation is optimized by the compiler, using
      feedback from a training run. These commands are
      done before the first compile (in phase "fdo_pre0"):

```
        mkdir /tmp/pp
        rm -f /tmp/pp/${baseexe}*
```

      and these flags are added to the first and second compiles:

```
        PASS1_CFLAGS = -prof_gen_noopt -prof_dir /tmp/pp
        PASS2_CFLAGS = -prof_use_feedback -prof_dir /tmp/pp
```

      (Peak builds use /tmp/pp above; base builds use /tmp/pb.)

+IFB: Icache usage is improved by the post-link-time optimizer
      Spike, using feedback from a training run. These commands
      are used (in phase "fdo_postN"):

```
        mv ${baseexe} oldexe
        spike oldexe -feedback oldexe -o ${baseexe}
```

+PFB: Prefetches are improved by the post-link-time optimizer
      Spike, using feedback from a training run. These
      commands are used (in phase "fdo_post_makeN"):

```
        rm -f *Counts*
        mv ${baseexe} oldexe
        pixie -stats dstride oldexe 1>pixie.out 2>pixie.err
        mv oldexe.pixie ${baseexe}
```

      A training run is carried out (in phase "fdo_runN"), and
      then this command (in phase "fdo_postN"):

```
        spike oldexe -fb oldexe -stride_prefetch -o ${baseexe}
```

When Spike is used for both Icache and Prefetch improvements,
only one spike command is actually issued, with the Icache
options followed by the Prefetch options.

Information on UNIX V5.1B Patches can be found at
http://ftp1.service.digital.com/public/unix/v5.1b/

Processes were bound to CPUs using "runon".

This result was measured on model ES80.
Model ES47 and model ES80 are electronically equivalent.
